

GALXY — Module 6: Cart

Individual Work Assignment

Jaiganesh — Add-to-Cart Integration & Guest Resume Flow

FRONTEND

Team Lead	Dhanush
Track	Frontend
Module	Module 6 — Cart (Flask · MongoDB · Frontend UI)
Primary File(s)/Area	frontend/product-configurator (add-to-cart)
Coordinates With	Dhanush (shared UI, cart page), Prashanth (add-item logic/errors), Module 5 team (AI preview hand-off)
Timeline Focus	Day 3–7: add-to-cart + guest resume flow. Day 8–11: stale-item triggers & polish.

Overview

Jaiganesh owns the entry point into the cart: the "Add to Cart" action on the product/configurator page, including the tricky guest-user flow where a not-logged-in customer needs to sign up first and then have their selection auto-added.

Tasks

- Build the **"Add to Cart"** action on the product/configurator page, wired to POST `/api/cart/items` with `product_id`, `selected_attributes`, `quantity`, and optionally `ai_preview_image` / `custom_text`.
- Implement the **guest → signup → auto-add-to-cart resume flow**: if a guest configures a product and hits Add to Cart, redirect to signup/login, preserve the pending selection client-side (e.g. `sessionStorage/memory`), then auto-fire the add-to-cart call once auth succeeds.
- Show success/error feedback for Add to Cart: 201 success toast + updated badge count, 400 invalid-attribute errors surfaced inline on the configurator, 404 if the product is no longer available.
- Implement the **stale-item UI states** on the cart page/drawer (`is_available: false`, `needs_attention: true`) in collaboration with Dhanush — you own detecting/triggering, Dhanush owns the shared visual components.
- Handle the AI preview hand-off: when Module 5 generates a preview image, make sure it's passed along in the add-to-cart payload as `ai_preview_image`.

Deliverables

- Working Add to Cart button + flow on the product/configurator page
- Working guest → signup → auto-add-to-cart resume flow
- Inline error handling for invalid attributes / unavailable products

Watch Out / Coordination Points

- The resume flow is purely client-side (`sessionStorage/memory`) — the backend never sees an unauthenticated add-to-cart call, per the module's auth-only rule.
- Confirm with Deepesh the exact 400/404 error payload shape so your inline error messages are accurate.
- Coordinate with Dhanush before styling anything cart-related, to avoid duplicate/divergent components.
